From the INTERNATIONAL PRELIMINARY EXAMINING AUTHORITY

To:

DE CLERCO, Ann De Clercq, Brants & Partners CV E. Gevaertdreef 10A B-9830 Sint-Martens-Latem BELGIQUE

NOTIFICATION OF TRANSMITTAL OF THE INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY

(PCT Rule 71.1)

Date of mailing (day/month/year)

22.05.2006

Applicant's or agent's file reference

PAM-027-PCT

International filing date (day/month/year)

Priority date (day/month/year)

IMPORTANT NOTIFICATION

International application No. PCT/EP2005/001267

08.02.2005

11.02.2004

Applicant

PAMGENE B.V. et al.

- The applicant is hereby notified that this International Preliminary Examining Authority transmits herewith the international preliminary report on patentability and its annexes, if any, established on the international application.
- A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication to all the elected Offices.
- Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.

4. REMINDER

The applicant must enter the national phase before each elected Office by performing certain acts (filingtranslations and paying national fees) within 30 months from the priority date (or later in some Offices) (Article 39(1)) (see also the reminder sent by the International Bureau with Form PCT/IB/301).

Where a translation of the international application must be turnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary report on patentability. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

For further details on the applicable time limits and requirements of the elected Offices, see Volume II of the PCT Applicant's Guide.

The applicant's attention is drawn to Article 33(5), which provides that the criteria of novelty, inventive step and industrial applicability described in Article 33(2) to (4) merely serve the purposes of international preliminary examination and that "any Contracting State may apply additional or different criteria for the purposes of deciding whether, in that State, the claimed inventions is patentable or not" (see also Article 27(5)). Such additional criteria may relate, for example, to exemptions from patentability, requirements for enabling disclosure, clarity and support for the claims.

AP20 Rec'd PCT/FTQ 20 JUL 2006

INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY (SEPARATE SHEET)

International application No.

PCT/EP2005/001267

Re Item V

Reasoned statement with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

1) Reference is made to the following documents:

D4: US-A-5 556 598 (KENRICK MICHAEL K ET AL) 17 September 1996 (1996-09-17)

2) The document D4 is regarded as being the closest prior art to the subject-matter of claim 1, and shows (the references in parentheses applying to this document):

A device for analysing an interaction between target and probe molecules, comprising:

- a tubular housing having a proximal end and a distal end defining an internal flow passageway (D4, fig 1), and
- a flow through support member provided within or on the housing obstructing said internal passageway (D4, feature 17),

whereby said flow through support member is in the form of a sheet, film or membrane is provided with through going channels, said channels provided with probe molecules suitable for allowing an interaction between target and probe molecules (D4, col 5, lines 54-61).

The subject-matter of claim 1 differs from this known in that:

The flow trough support member is provided with through going channels having a pore size diameter between 50- 400 nm.

The subject-matter of claim 1 is therefore new (Article 33(2) PCT).

The problem to be solved by the present invention may be regarded as to be able to maximize the binding capacity of the flow trough support member.

The solution to this problem proposed in claim 1 of the present application is considered

Form PCT/Separate Sheet/409 (Sheet 1) (EPO-April 2005)

INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY (SEPARATE SHEET)

International application No.

PCT/EP2005/001267

as involving an inventive step (Article 33(3) PCT) for the following reasons:

Document D4, teaches away from using flow trough support member having a pore size of between 50-400 nm, this may be inferred from D4, col 6, lines 21-27 disclosing that:

"1 micrometer membrane is preferred. [...] Also 0.45 micrometer nitrocellulose has been used successfully, as has 0.45 micrometer nylon, although the flow rate and hence washing efficiency were reduced (see Example 1)."

therefore the skilled person departing from D4 would not try to reduce more the pore size, as flow rate and washing efficiency problems will be expected.

None of the other documents at hand discloses flow trough support members in the form of sheets or membranes, or with this magnitude of pore size.

Claim 1, define therefore inventive subject-matter while solving the problem posed.

- 2.1) Claims 2-7 are dependent on claim 1 and as such also meet the requirements of the PCT with respect to novelty and inventive step.
- 3) The independent claims 8 (apparatus) and 9 (method) are to be used with the novel and inventive device defined in claim 1, and are therefore also new and inventive, mutatismutandis.

17-03-2006

EPO - DG 1

1 7. 03. 2026

Claims (retyped)

- 1. A device for analysing an interaction between target and probe molecules, comprising:
 - a tubular housing having a proximal end and a distal end defining an internal flow passageway, and
 - a flow through support member provided within or on the housing obstructing said internal passageway,

whereby said flow through support member is in the form of a sheet, film or membrane and is provided with through going channels having a pore size diameter between 50-400 nm, said channels provided with probe molecules suitable for allowing an interaction between target and probe molecules.

- 2. The device according to claim 1, whereby the support member is provided at or near the distal end of the housing.
- 3. The device according to claims 1 or 2, wherein said support member is chosen from the group consisting of metals, ceramic metal oxides, silicon, organic polymers and metal oxides, preferably aluminium oxide.
- 4. The device according to any of the claims 1 to 3, wherein said support member is optically transparent or translucent.
- 5. The device according to any of the claims 1 or 4, wherein said channels extend substantially coaxial with the longitudinal axis of the housing.
- 6. The device according to any of the claims 1 to 5, wherein the plane of the support member extends substantially perpendicular to the longitudinal axis of the housing.

8

- 7. The device according to any of the claims 1 to 6, wherein the support member spans the bore of the housing.
- 8. An apparatus for analysing an interaction between target and probe molecules, comprising:
- a handling station comprising a handling device, for aspirating and/or dispensing fluid medium, said handling device comprising a device according to any of the claims 1 to 7, mounted thereto,
- (b) a means for transporting said handling station to a plurality of sections,
- (c) at least one incubation section comprising an incubation device, for administering a fluid sample comprising target molecules to the support member, incubating the support member comprising the fluid sample and/or washing the support member, and
- (d) an analysis section comprising a detection device for detecting an interaction between target and probe molecules, thereby analysing an interaction.
- 9. Method for the analysis of an interaction between target and probe molecules, comprising:
- administering a sample fluid possibly comprising target molecules to the support member of the device according to any of the claims 1 to 7, or the apparatus of claim 8,
- (b) entering the sample fluid into the channels of the support member by capillary forces or by applying a pressure difference over the support member, whereby the target molecules are contacted with the probe molecules,
- (c) possibly generating an alternating flow through the support member whereby at least part of the sample is forced to pass through the channels from the distal slde of the support member to the proximal side of the support member and back at least one time, under conditions enabling the interaction between target and probe molecules, and
- (d) analysing an interaction between target and probe molecules.
